

11. (Amended) An electronic device comprising:
a reflection type liquid crystal display panel comprising an active matrix substrate and a counter substrate, said active matrix substrate having a plurality of thin film transistors and a plurality of pixel electrodes connected with the thin film transistors; and

D2
at least two light sources located on sides of the display panel in opposition to each other, each of light sources comprising a plurality of light emitting diode lamps,

wherein each of said light emitting diode lamps comprises a red light emitting diode, a blue light emitting diode, and a green light emitting diode arranged in delta, and

wherein light emitted from each of the light sources is introduced into the panel from a side of said counter substrate.

15. (Amended) An electronic device comprising:

a reflection type liquid crystal display panel comprising an active matrix substrate and a counter substrate, said active matrix substrate having a plurality of thin film transistors and a plurality of pixel electrodes connected with the thin film transistors; and

D3
at least two light sources located on sides of the display panel in opposition to each other, each of light sources comprising a plurality of light emitting diode lamps,

wherein each of said light emitting diode lamps comprises a red light emitting diode, a blue light emitting diode, and a green light emitting diode located on a substrate and coated with resin and arranged in delta, and

wherein light emitted from each of the light sources is introduced into the panel from a side of said counter substrate.

19. (Amended) An electronic device comprising:

D4
a reflection type liquid crystal display panel comprising an active matrix substrate and a counter substrate, said active matrix substrate having a plurality of thin

film transistors and a plurality of pixel electrodes connected with the thin film transistors; and

at least two light sources located on sides of the display panel in opposition to each other, each of light sources comprising a plurality of light emitting diode lamps ranged in line,

wherein each of said light emitting diode lamps comprises a red light emitting diode, a blue light emitting diode, and a green light emitting diode arranged in delta, and

wherein light emitted from each of the light sources is introduced into the panel from a side of said counter substrate.

D4
Cancelled

23. (Amended) An electronic device comprising:

a reflection type liquid crystal display panel comprising an active matrix substrate and a counter substrate, said active matrix substrate having a plurality of thin film transistors and a plurality of pixel electrodes connected with the thin film transistors; and

at least two light sources located on sides of the display panel in opposition to each other, each of light sources comprising a plurality of light emitting diode lamps,

wherein each of said light emitting diode lamps comprises a red light emitting diode, a blue light emitting diode, and a green light emitting diode arranged in delta,

wherein light emitted from each of the light sources is introduced into the panel from a side of said counter substrate, and

wherein said counter substrate has a plurality of inclined surfaces on an opposite side of the active matrix substrate.
